

Positive&Negative Agents

- Contrast agents fill a structure with a material that has a different density than that of the structure.

1-When the agent is of a higher density than the structure it is referred to as a **positive agent**.

2-When the agent is of a lower density than the surrounding structure it is referred to as a **negative agent**.

3-Certain gastrointestinal agents possess a density similar to that of water and are sometimes referred as **neutral contrast agents**.
